

LIFETIME LIMITED
WARRANTY

Maintenance and Cleaning – New Windows and Doors

1. Sills, roller tracks and water drainage holes (“weep” holes) should be cleared of construction debris to allow proper water drainage.
2. The sill should be level and the frame square in the opening. When closed, the margin around the operating window or door sash should appear even.
3. Locks and latches should operate smoothly.
4. Carefully remove all labels from the glass after final code inspection. Use warm water, common glass cleaner or mild household detergent solution with a clean cloth to clean glass and vinyl. Avoid use of tools or abrasive materials that may scratch the glass or vinyl. Do not use strong solvents or concentrated solutions of vinegar, bleach or ammonia to clean. These may cause damage or discoloration.

Maintenance and Cleaning – Ongoing

All windows require some basic maintenance and cleaning to keep them looking good and operating smoothly.

1. Keep sills, roller tracks and weep holes clear of dirt and debris that may damage rollers, interfere with operation or block water drainage.
2. All moving metal parts may be treated with light lubricant periodically as needed to improve operation. In corrosive environments such as coastal or industrial areas, exposed metal parts should be cleaned periodically and coated with a marine-grade lubricant to slow corrosion. (See warranty for more details on hardware corrosion.)
3. Use warm water, common glass cleaner or mild household detergent solution with a clean cloth to clean glass and vinyl. Avoid use of tools or abrasive materials that may scratch the glass or vinyl. Do not use strong solvents or concentrated solutions of vinegar, bleach or ammonia to clean. These may cause damage or discoloration.
